CMO: Duality

Eklavya Sharma

1 Duality

Consider the optimization problem P:

 $\min_{x \in \mathbb{R}^d} f(x) \text{ where } \forall i \in I, c_i(x) \ge 0 \land \forall j \in J, h_j(x) = 0$

The corresponding Lagrangian is

$$L(x,\lambda,\mu) = f(x) - \lambda^T c(x) - \mu^T h(x)$$

Define g as

$$g(\lambda,\mu) = \min_{x \in \mathbb{R}^d} L(x,\lambda,\mu)$$

Let D be this optimization problem:

$$\max_{\lambda,\mu} g(\lambda,\mu) \text{ where } g(\lambda,\mu) \neq -\infty \land \lambda \ge 0$$

Then D is said to be the dual of P.

Theorem 1 (Weak duality theorem). Let x_0 be a feasible solution to P and (λ_0, μ_0) be feasible solution to D. Then

$$g(\lambda_0, \mu_0) \le L(x_0, \lambda_0, \mu_0) \le f(x_0)$$

Proof.

$$g(\lambda_0, \mu_0)$$

$$= \min_{x \in \mathbb{R}^d} L(x, \lambda_0, \mu_0)$$

$$\leq L(x_0, \lambda_0, \mu_0)$$

$$= f(x_0) - \lambda_0^T c(x_0) - \mu^T h(x_0)$$

$$\leq f(x_0) \qquad (\lambda_0 \ge 0 \land c(x_0) \ge 0 \land h(x_0) = 0 \text{ by feasibility})$$

Definition 1 (Duality gap). Let x^* be the optimal solution to P and (λ^*, μ^*) be the optimal solution to D. Then the duality gap is defined to be the quantity

$$f(x^*) - g(\lambda^*, \mu^*)$$

Corollary 1.1. Let x_0 be a feasible solution to P and (λ_0, μ_0) be a feasible solution to D. If $f(x_0) = g(\lambda_0, \mu_0)$, then the duality gap is 0 and x_0 and (λ_0, μ_0) are optimal solutions.

Proof. Let x^* be the optimal solution to P and (λ^*, μ^*) be the optimal solution to D. Then

$$g(\lambda_0, \mu_0) \le g(\lambda^*, \mu^*) \le f(x^*) \le f(x_0) = g(\lambda_0, \mu_0)$$

Therefore,

$$g(\lambda_0, \mu_0) = g(\lambda^*, \mu^*) = f(x^*) = f(x_0)$$

2 Wolfe Dual

We'll now focus our attention on convex optimization problems. In the optimization problem P:

- Let f be a convex function.
- Let $c_i(x) = -f_i(x)$, where f_i is a convex function.
- Let $h_j(x) = a_j^T x b_j$, where $a_j \in \mathbb{R}^d$ and $b \in \mathbb{R}^{|I|}$. Let A be the matrix whose j^{th} column is a_j .

Let WD be the optimization problem

$$\max_{x,\lambda,\mu} L(x,\lambda,\mu) \text{ where } \lambda \geq 0 \wedge \nabla_{\!\! x} L(x,\lambda,\mu) = 0$$

This problem is called the Wolfe Dual of P.

Theorem 2 (Proved previously). Let f be C^1 and convex. Then

$$\forall u, v \in \mathbb{R}^d, f(v) \ge f(u) + \nabla_f(u)^T (v - u)$$

Lemma 3 (Proved previously). Let (x^*, λ^*, μ^*) be a KKT point. Then $f(x^*) = L(x^*, \mu^*, \lambda^*)$.

Theorem 4. Let (x^*, λ^*, μ^*) be a KKT point of P. Then (x^*, λ^*, μ^*) is the optimal solution to WD.

Proof. Let (x, λ, μ) be a feasible point of WD.

$$\begin{split} L(x^*, \lambda^*, \mu^*) &= f(x^*) & \text{(by lemma 3)} \\ \geq L(x^*, \lambda, \mu) & \text{(by } \lambda \geq 0 \text{ and weak duality)} \\ &= f(x^*) + \sum_i \lambda_i f_i(x^*) + \sum_j \mu_j(a_j^T x^* - b_j) \\ \geq (f(x) + \nabla_f(x)^T (x^* - x)) \\ &+ \sum_i \lambda_i (f_i(x) + \nabla_{f_i}(x)^T (x^* - x)) \\ &+ \sum_j \mu_j(a_j^T (x^* - x) - (a_j^T x - b_j)) & \text{(by theorem 2)} \\ &= \left(f(x) + \sum_i \lambda_i f_i(x) + \sum_j \mu_j(a_j^T x - b_j) \right) \\ &+ (x^* - x)^T \left(\nabla_f(x) + \sum_i \lambda_i \nabla_{f_i}(x) + \sum_j \mu_j a_j \right) \\ &= L(x, \lambda, \mu) + (x^* - x)^T (\nabla_x L(x, \lambda, \mu)) \\ &= L(x, \lambda, \mu) & \text{(feasibility of WD implies } \nabla_x L(x, \lambda, \mu) = 0) \end{split}$$

Therefore, (x^*, λ^*, μ^*) maximizes WD.

Therefore, to find the KKT point of a problem, we can optimize its Wolfe Dual.

Example 1.

$$\min_{x} \frac{1}{2} \|x\|^2 \quad where \ A^T x \ge b$$

The Lagrangian for this problem is

$$L(x,\lambda) = \frac{1}{2} ||x||^2 - \lambda^T (A^T x - b)$$
$$\nabla_x L(x,\lambda) = x - A\lambda$$

The Wolfe Dual is

$$\max_{x,\lambda} \frac{1}{2} \|x\|^2 - \lambda^T (A^T x - b) \text{ where } x - A\lambda = 0 \text{ and } \lambda \ge 0$$

We can simplify this by substituting $x = A\lambda$ and removing the constraint

$$\max_{\lambda} b^T \lambda - \frac{1}{2} \|A\lambda\|^2 \quad where \ \lambda \ge 0$$

Example 2.

$$\min_{x} c^{T} x \text{ where } x \ge 0 \land Ax \ge b$$

The Lagrangian for this problem is

 $L(x,\lambda,\pi) = c^T x - \lambda^T (Ax - b) - \pi^T x = (c - A^T \lambda - \pi)^T x + b^T \lambda$ $\nabla_x L(x,\lambda,\pi) = c - A^T \lambda - \pi$

The Wolfe Dual is

$$\max_{x,\lambda,\pi} (c - A^T \lambda - \pi)^T x + b^T \lambda \text{ where } c - A^T \lambda - \pi = 0 \text{ and } \lambda \ge 0 \text{ and } \pi \ge 0$$

We can simplify this by substituting $\pi = c - A^T \lambda$ and removing the constraint

$$\max_{x,\lambda} b^T \lambda \text{ where } A^T \lambda \leq c \text{ and } \lambda \geq 0$$

This gives us the dual linear program for this problem.
